

REPORT

ECE 6680 Lab #8 – Real Time Scheduling using RMA

Objective:

To perform Rate Monotonic Analysis (RMA) and determine if the given system design is schedulable.

System Design:

The system in consideration is **Inertial Navigation System (INS)**. It is a real-time shipboard avionic system which has strict time constraints for providing information to other shipboard devices. The top level design specifies that INS has to comply with the following timing constraints for its tasks:

| Tasks | Period (ms) |
|----------------------------|-------------|
| Compute attitude data | 2.56 |
| Compute velocity data | 40.96 |
| Compute position data | 1,280.00 |
| Display data | 1,000.00 |
| Compose attitude message | 61.44 |
| Compose navigation message | 1,024.00 |

The design specifies that the Tasks are periodic but not be independent. All tasks share the same result table (write mode for computational tasks, read mode for all others). The attitude and navigation message composition tasks share the same I/O channel. The system will run on a platform using a Motorola MC68302 microcontroller and a Linux real-time kernel, which offers a priority ceiling protocol. The overhead for this system is 153 μ s per task. The estimated the execution times and resource usage times for each of the tasks is given below:

| Task | Run time (ms) | Result table usage (ms) | I/O channel usage (ms) |
|-------------|---------------|-------------------------|------------------------|
| attitude | 1.30 | 0.20 | - |
| velocity | 4.70 | 0.20 | - |
| position | 3.00 | 0.20 | - |
| display | 23.00 | 0.30 | - |
| att message | 9.00 | 0.15 | 3.00 |
| nav message | 38.30 | 0.30 | 6.00 |

Implementation:

Rate Monotonic Analysis for schedulability follows the steps listed below:

a) Assign priority to each task :

- Unique priorities to each task are set pre-execution. The shorter the period of the task the higher is its priority.

b) Calculate blocking time for priority ceiling protocol :

- For each task and the corresponding resources associated with it, maximum blocking time is calculated and total blocking time of the task is determined.
- In priority ceiling protocol, the maximum blocking time for a task (T_i) on resource (R_i) is the maximum of Direct Blocking and Push-through Blocking.
- Direct blocking occurs when higher priority task waits on the lower priority task and Push-through blocking occurs when medium priority tasks wait due to temporary priority inheritance.
- The total maximum blocking of each task (B_i) is the summation of maximum blocking time of the task (T_i) on each of the resources (R_i).
- Below table illustrates all the tasks along with their corresponding resources and execution details :

| Task | Run time R (ms) | Period T (ms) | Priority ($P_1 = \text{Highest}$) | Resource 1: Result table usage (ms) R1 Ceiling Priority = P1 | | | | Resource 2: I/O usage (ms) R2 Ceiling Priority = P3 | | | | Total Max Blocking B_i (ms) |
|----------|-----------------|---------------|-------------------------------------|---|-------------------|-------------------------|----------------------|--|-------------------|-------------------------|----------------------|-------------------------------|
| | | | | Usage Time | Max. Block Direct | Max. Block Push Through | Max. Blocking for R1 | Usage Time | Max. Block Direct | Max. Block Push Through | Max. Blocking for R2 | |
| attitude | 1.30 | 2.56 | P1 | 0.20 | 0.30 | 0 | 0.30 | 0 | 0 | 0 | 0 | 0.30 |
| velocity | 4.70 | 40.96 | P2 | 0.20 | 0.30 | 0 | 0.30 | 0 | 0 | 0 | 0 | 0.30 |
| Att msg | 9.00 | 61.44 | P3 | 0.15 | 0.30 | 0 | 0.30 | 3.00 | 6.00 | 0 | 6.00 | 6.30 |
| display | 23.00 | 1000.00 | P4 | 0.30 | 0.30 | 0 | 0.30 | 0 | 0 | 6.00 | 6.00 | 6.30 |
| Nav msg | 38.00 | 1024.00 | P5 | 0.30 | 0.20 | 0 | 0.20 | 6.00 | 0 | 0 | 0 | 0.20 |
| Position | 3.00 | 1280.00 | P6 | 0.20 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Total Max Blocking Time $B_i = \text{Max. Blocking for R1} + \text{Max. Blocking for R2}$

c) Perform Rate Monotonic Analysis with overhead and blocking:

- Using the above illustrated table and below mentioned formula, schedulability test is performed:

[Formula:]

$$\min_{(k,l)} \sum_{j=1}^{i-1} [(R_j + O_v) * \text{ceil}(l * T_k / T_j)] + R_i + O_v + B_i \leq (l * T_k)$$

LHS RHS

Where,

n = number of tasks = 6;

Vi = 1 n;

Let k = 1 i;

Let l = 1 floor[Ti/Tk];

Ti = Period of Task i;

Tk = Period of task k;

Ov = System overhead = 153 micro seconds;

Bi = Total Max Blocking Time of Task i;

Ri = Runtime of Task i;

[Code Snippet]:

```
for(i = 1; i <= TOTAL_TASKS ; i++){ /* i = 1 .....n; n = no. of tasks*/
    isSchedulable = 0; /*Initialize to 0*/
    for(k = 1; k <= i; k++){ /* k = 1.....i */
        limit = (int)floor(Tasks[i-1].Period/Tasks[k-1].Period);
        for(l = 1; l <= limit; l++){ /* l = 1 .... |(Ti/Tk)| */
            summation = 0; /* initialize to 0 */
            condition = l * Tasks[k-1].Period; /* RHS = (l*Tk) */
            for(j = 1; j < i; j++){
                summation = summation + (Tasks[j-1].RunTime + SYSTEM_OVERHEAD)
                    * (float)ceil((l*Tasks[k-1].Period)/Tasks[j-1].Period);
            }
            summation = summation +
                Tasks[i-1].Max_BlockingTime + Tasks[i-1].RunTime + SYSTEM_OVERHEAD;
            /*Schedulability Test Condition*/
            if(summation <= condition){
                isSchedulable = 1;
                printf("Condition satisfied for
                    i = %d k = %d l = %d summation = %f condition = %f\n", \
                    i, k, l, summation, condition);
                break; /*increment i*/
            }
            else
            {
                isSchedulable = 0;
                printf("Condition NOT satisfied for i = %d k = %d l = %d
                    summation = %f condition = %f\n", i, k, l, summation, condition); /*increment l*/
            }
            }break; /*increments i*/
        }
    }
}
```

d) Rate Monotonic Analysis Result:

The Schedulability theorem results are summarized below:

| Theorem Result | i | k | l [Single/Range] | LHS of Test | RHS of Test |
|-----------------------|----------|----------|-------------------------|--------------------|--------------------|
| Pass | 1 | 1 | 1 | 1.753000 | 2.560000 |
| Fail | 2 | 1 | 1-4 | - | - |
| Pass | 2 | 1 | 5 | 12.418000 | 12.800000 |
| Fail | 3 | 1 | 1-22 | - | - |
| Pass | 3 | 1 | 23 | 58.578000 | 58.880000 |
| Fail | 4 | 1 | 1-85 | - | - |
| Pass | 4 | 1 | 86 | 220.141000 | 220.160000 |
| Fail | 5 | 1 | 1-157 | - | - |
| Pass | 5 | 1 | 158 | 403.981000 | 404.480000 |
| Fail | 6 | 1 | 1-164 | - | - |
| Pass | 6 | 1 | 165 | 421.958000 | 422.400000 |

➤ **[Conclusion]:** RMA determined that the designed system is **schedulable**.
